Top-down Tree Transducer

Definition

- **linear** if no repeat variable in rhs

Top-down Tree Transducer

Definition

- **linear** if no repeat variable in rhs
- **nondeleting** if every variable of lhs occurs in rhs

Top-down Tree Transducer

Definition

- **linear** if no repeat variable in rhs
- **nondeleting** if every variable of lhs occurs in rhs
- **deterministic** if lhs uniquely determines rhs (and at most 1 initial state)

Top-down Tree Transducer

Definition

- **linear** if no repeat variable in rhs
- **nondeleting** if every variable of lhs occurs in rhs
- **deterministic** if lhs uniquely determines rhs (and at most 1 initial state)
- **total** if at least one rule exists for every lhs (and at least 1 initial state)

Top-down Tree Transducer

Example

Top-down Tree Transducer

Example

not linear (copying), **nondeleting**, **not deterministic**, and **total**

General Composition Strategy

Translation of 1st transducer

General Composition Strategy

Translation of 1st transducer

Translation of 2nd transducer

General Composition Strategy

- 1 Start both transducers on input (in correct order)
- 2 Apply derivation step of 1st transducer
- 3 Apply derivation steps of 2nd transducer as long as possible
(to immediately consume intermediate trees)

General Composition Strategy

Interspersed translation

General Composition Strategy

- Strategy also works on rule level
(combine single rule of 1st transducer + some rules of 2nd transducer)
- Pair states $\begin{matrix} p \\ | \\ q \end{matrix}$ to simply $\langle p, q \rangle$
- Yields classical composition construction
- **Not** universally correct, but yields celebrated composition results

General Composition Strategy

- Strategy also works on rule level
(combine single rule of 1st transducer + some rules of 2nd transducer)
- Pair states $\begin{matrix} p \\ | \\ q \end{matrix}$ to simply $\langle p, q \rangle$
- Yields classical composition construction
- **Not** universally correct, but yields celebrated composition results

General Composition Strategy

Composition results [Engelfriet 1975], [Baker 1979]

Case	1st transducer	2nd transducer
(a)		linear and nondeleting
(b)	total	linear
(c)	deterministic	nondeleting
(d)	deterministic and total	

General Composition Strategy

Composition results [Engelfriet 1975], [Baker 1979]

Case	1st transducer	2nd transducer
(a)		linear and nondeleting
(b)	total	linear
(c)	deterministic	nondeleting
(d)	deterministic and total	

Problem

- Transducers in NLP usually not deterministic
- Rotation requires nonlinear transducers
- Rotation is relevant linguistic reordering

excluding (c) and (d)
excluding (a) and (b)

Problem

- Transducers in NLP usually not deterministic
- Rotation requires nonlinear transducers
- Rotation is relevant linguistic reordering

excluding (c) and (d)
excluding (a) and (b)

Rotation

Extended Top-down Tree Transducer

Rule shape

[Arnold, Dauchet 1976], [\sim , Graehl, Hopkins, Knight 2009]

(Disallow lhs $\begin{matrix} q \\ | \\ x_1 \end{matrix}$)

Extended Top-down Tree Transducer

Example rules

Extended Top-down Tree Transducer

Example rules

- Rotation via linear transducer (linear, nondeleting defined as before)
- Replace **deterministic** by **functional**
(every state can translate every input tree in at most one manner)
- Replace **total** by **total**
(every state can translate every input tree in at least one manner)

General composition strategy

- Still works on derivation level
- **But** fails on rule level
(potentially cannot process full intermediate tree fragment)

General Composition Strategy

General Composition Strategy

Classical transducers (unextended)

Case	1st transducer	2nd transducer
(a)		linear and nondeleting
(b)	total	linear
(c)	functional	nondeleting
(d)	functional and total	

- Mixed composition results mostly unknown for extended transducers
- Most results require 1 transducer to be classical (unextended)

Composition Closure

- Composition closure level is smallest number of transducers needed to simulate any composition chain
- Class closed under composition \iff Level = 1

Classical transducers

Case	Level	Remarks
linear, nondel., nonerasing	1	closed
linear, nondel.	1	closed
functional, total	1	closed
linear	2	regular look-ahead obtained at level 2
linear with regular look-ahead	1	closed

Composition closures [Engelfriet, Fülöp, ~ 2017]

	Case	Classical	Extended
linear, nondeleting, and nonerasing		1	

Composition closures [Engelfriet, Fülöp, ~ 2017]

Case	Classical	Extended
linear, nondeleting, and nonerasing	1	2
linear and nondeleting	1	

Composition closures [Engelfriet, Fülöp, ~ 2017]

Case	Classical	Extended
linear, nondeleting, and nonerasing	1	2
linear and nondeleting	1	∞
functional and total	1	

Composition Closure

Composition closures [Engelfriet, Fülöp, ~ 2017]

Case	Classical	Extended
linear, nondeleting, and nonerasing	1	2
linear and nondeleting	1	∞
functional and total	1	?
linear	2	

Composition Closure

Composition closures [Engelfriet, Fülöp, ~ 2017]

Case	Classical	Extended
linear, nondeleting, and nonerasing	1	2
linear and nondeleting	1	∞
functional and total	1	?
linear	2	4
linear with regular look-ahead	1	

Composition Closure

Composition closures [Engelfriet, Fülöp, ~ 2017]

Case	Classical	Extended
linear, nondeleting, and nonerasing	1	2
linear and nondeleting	1	∞
functional and total	1	?
linear	2	4
linear with regular look-ahead	1	3

Composition Closure

Extended Top-down Tree Transducer

- General composition strategy fails on rule level due to extended 2nd transducer
- Restrict to extended transducers followed by classical transducers
- Strategy works as expected

Composition results [Engelfriet 1975], [Baker 1979]

Case	Extended 1st transducer	Classical 2nd transducer
(a)		linear and nondeleting
(b)	total	linear
(c)	functional	nondeleting
(d)	functional and total	

Another extension

- Weights used in practice to resolve nondeterminism
- Each rule is assigned weight
- Weights multiplied along derivation
- Weights of alternatives are added

Typical weights

- Probabilities
- Costs
- Flows
- Profits

Definition

Commutative semiring $(C, +, \cdot, 0, 1)$ if

- $(C, +, 0)$ and $(C, \cdot, 1)$ commutative monoids
- \cdot distributes over finite (incl. empty) sums

Idempotent if $c + c = c$

Definition

Commutative semiring $(C, +, \cdot, 0, 1)$ if

- $(C, +, 0)$ and $(C, \cdot, 1)$ commutative monoids
- \cdot distributes over finite (incl. empty) sums

Idempotent if $c + c = c$

Examples

- Boolean semiring $(\{0, 1\}, \max, \min, 0, 1)$ (idempotent)
- semiring $(\mathbb{N}, +, \cdot, 0, 1)$ of non-negative integers
- tropical semiring $(\mathbb{N} \cup \{\infty\}, \min, +, \infty, 0)$ (idempotent)
- any field, ring, etc.

Weighted Extended Top-down Tree Transducer

Rule shape

[Fülöp, ~, Vogler 2011]

(Disallow lhs $\begin{pmatrix} q \\ | \\ x_1 \end{pmatrix}$)

Weighted Extended Top-down Tree Transducer

Rule shape

[Fülöp, ~, Vogler 2011]

(Disallow lhs $\begin{pmatrix} q \\ | \\ x_1 \end{pmatrix}$)

Adjustment of semantics

- Weight of derivation is product of rule weights
(rule weight taken as often as rule is used)

Adjustment of semantics

- Weight of derivation is product of rule weights
(rule weight taken as often as rule is used)
- Weight of translation is sum of all derivations for that translation
(actually only left-most derivations to normalize rewrite order)

Weighted Extended Top-down Tree Transducer

Example rules with integer weights

Weighted Extended Top-down Tree Transducer

Example rules with integer weights

Example derivation of weight $2 \cdot 1 \cdot 3 \cdot 3 \cdot 1$

Weighted Composition

Given $\tau_1: T_\Sigma \times T_\Gamma \rightarrow C$ and $\tau_2: T_\Gamma \times T_\Delta \rightarrow C$

$$(\tau_1 ; \tau_2)(s, u) = \sum_{t \in T_\Gamma} \tau_1(s, t) \cdot \tau_2(t, u)$$

Weighted Composition

Given $\tau_1: T_\Sigma \times T_\Gamma \rightarrow C$ and $\tau_2: T_\Gamma \times T_\Delta \rightarrow C$

$$(\tau_1 ; \tau_2)(s, u) = \sum_{t \in T_\Gamma} \tau_1(s, t) \cdot \tau_2(t, u)$$

Notes

- Weighted composition is standard matrix product
(identify $\tau_1 \in C^{T_\Sigma \times T_\Gamma}$ and $\tau_2 \in C^{T_\Gamma \times T_\Delta}$)
- Distributivity and commutativity allow general composition strategy
(but derivations have weights now)

General Composition Strategy

Weighted Composition Results

Illustration of rule construction

Definition

$q \in Q$ **constant** if there is $c \in C$ such that for every tree $s \in T_\Sigma$

$$\sum_{t \in T_\Gamma} \sum_{\substack{\text{derivation } d \\ \text{from } q(s) \text{ to } t}} \text{wt}(d) = c$$

Definition

$q \in Q$ **constant** if there is $c \in C$ such that for every tree $s \in T_\Sigma$

$$\sum_{t \in T_\Gamma} \sum_{\substack{\text{derivation } d \\ \text{from } q(s) \text{ to } t}} \text{wt}(d) = c$$

Examples of 1-constant states

- Total transducer over Boolean semiring (here: constant = total)
- Boolean and total transducer over idempotent semiring
- Functional, total, and Boolean transducer

Weighted Composition Results
